

i-Tree Design Assignment

In this assignment, you will explore the use of i-Tree Design in a real world setting of your choice. You will choose a parcel in your community, or a site that you are familiar with, and you will locate, identify, and provide details on trees growing on the site. You should choose a parcel that has a building on it, so that you will be able to utilize the 'energy savings tool' that is part of Design.

Follow the steps below to complete the assignment:

1. Open i-Tree Design in your browser - <https://design.itreetools.org/> (Links to an external site.)
2. Create a new project.
3. Add one structure and at least three trees.
4. Save project file to your computer using the Save Project button.
5. Close your browser, clear cache, and then open project file in i-Tree Design.
6. View and Save project report.
7. Submit project report and the .dsgnprj project file to the instructor.

Note: Depending on your internet browser, you can either download the report as a PDF, or, the browsers "Print" option typically will have an option to "Save as a PDF" to create a file that can be sent as an attachment.
